```
The present sequence is the human calcium binding protein hCBP. It was obtained by screening a coronary artery smooth muscle cDNA library, from which five overlapping nucleic acids were isolated, sequenced and expressed to give the protein. The protein and the gene encoding it are useful for the diagnosis and treatment of the following types of disorder: cancers (such as adenocarcinomas), reproductive disorders (such as infertility, ovulatory defects, endometriosis, disruptions of the coestrus and menstrual cycles, polycystic ovary syndrome and ovarian hyperstamlation), autoimmune disorders (such as benign prostatic cypperplasia and prostatitis), developmental disorders (such as Cushing's syndrome, muscular dystrophy and gonadal dysgenesis), hereditary cucupathies, seizure disorders, immune disorders (such as AIDS, collecses, diabetes, Graves' disease, multiple sclerosis, psoriasis, crhumatoid arthritis, golaroderma, Sjogren's syndrome and ulcerative colitis), and viral, bacterial, fungal, parasitic, protozoal and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        121 AHPHILFMLKGYEAPQIALRCGIMLRECIRHEPLAKIILFSNOFRDFFKYVELSTFDIA 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the protein sequence for human Acute Neuronal Induced Calcium Binding Protein (ANIC-BP). ANIC-BP coding sequence and protein are useful for treating stroke, acute head trauma, multiple sclerosis and spinal cord injury. ANIC-BP coding sequence and protein are also useful as vaccines for inducing an immunological response in a

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM18642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral solerosis, and Shybrager Syndrome. Other uses include the utilisation of the activities such as Immune system suppression, Activity, chemotactic/chemokinetic activity, haemostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Wang D;

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous and central nervous system diseases, such as closalised neuropathies and central nervous system diseases, such as localised neuropathies and central nervous system diseases, such as allocations as disease, amyotrophic alteral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity chemotactic/chemokinetic activity haemostatic activity, haemostatic and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form by art of the printed specification.
                                                                                                                                                                                                                                                                                                                                                            0
                                                                                                                                                                                                                                                                                                                                                                                            170

The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide comprisentary to the
complementary strand of a polyuncleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the
oligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide which comprises at least 15 nucleotides and the combination of
the 5'-end sequence(3'-end sequence) where the
coligonucleotide which comprises at least 15 nucleotides and the combination of
the 5'-end sequence(3'-end sequence in selected from those defined in the
specification. The primer sets can be used in antisense therapy and in
gene therapy. The primers are useful for synthesising polynucleotides,
centerially without any specialised methods. Athelists encoded by
the full-length cDNAs. The primers are also useful for the
detection and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers allow obtaining of the full-length
CDNAs easily without any specialised methods. Athelists to AAH13623 represent
coligonucleotides, all of which are used in the exemplification of the

The present sequence is the mouse calcium binding protein MODS. It was used in a sequence alignment to identify human calcium binding protein C used in a sequence alignment to identify human calcium binding protein characters. The hCBP protein and the gene encoding it are useful for the as adenocarcinomas, reproductive disorders (such as infertility, covulatory defects, endometriosis, disruptions of the oestrus and mentrual cycles, polycystic ovary syndrome and ovarian prostatic ovary syndrome and ovarian hyperstimulation), autoimmune disorders (such as benign prostatic syndrome, muscular dystrophy and gonadal dysgenesis), hereditary neuropathies, seizure disorders, immune disorders (such as ALDS, allergies, anaemia, asthma, atherosclerosis, cholecystitis, Crohn's disease, diabetes, Graves' disease, multiple sclerosis, psoriasis, cheumatoid arthritis, scleroderma, Sjogren's syndrome and ulcerative colitis), and viral, bacterial, fungal, parasitic, protozoal and helminthic infections
                                                                                                                                                                                                                                   Human hCBP protein, and the nucleic acid encoding it, useful for e.g. diagnosis, prevention and treatment of cancers, immune, developmental or reproductive disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to human acute neuronal induced calcium-binding protein (ANIC-BP) and to nucleic acid encoding it. The invention also relates to expression systems and recombinant host cells comprising ANIC-BP DNA, the recombinant production of ANIC-BP, antibodies specific for ANIC-BP, fusion proteins comprising ANIC-BP, antibodies specific for region, and methods of screening ANIC-BP and an immunoglobulin FC region, and methods of screening ANIC-BP and an immunoglobulin FC and ANIC-BP proteins and nucleotides are useful for treating stroke and acute head trauma, multiple sclerosis and spinal cord injury. ANIC-BP proteins are useful in screening assays, for identifying membrane bound or soluble are useful in screening assays, for identifying membrane bound or soluble diagnostic reagents, as tools for tissue expression studies, for diagnostic reagents studies, as genetic vaccines, and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and in the surface and an interpretation surface and an interpretation surface and an interpretation surface and an interpretation surface and an interpretation surface and an interpretation surface and an interpretation surface and an interpretation surface and an interpretation surface and an interpretation surface and an interpretation surface and an interpretation surface and an interpretation surface and an interpretation surface and an interpretation surface and an interpretation and an int

The present sequence is that of a novel human acute neuronal induced calcium binding protein-like protein splice variant, ANIC-NP-1B. The protein shows homology to other members of the calcium binding protein family, including ANIC-BP, a protein discovered by mRNA differential display that is upregulated in a rat model of head trauma. ANIC-BP and ANIC-BP-1B differ in their C-terminal portions. The variant protein could serve as a novel drug target. The invention provides ANIC-BP-1B colymucleotides (see AAR30688) and polypeptides, expression vectors, host cells and antibodies, as well as methods for producing the protein and correcting or preventing disorders associated with expression of the protein by inhibiting or activating the action of ANIC-BP-1B. Diseases that may be treated include stroke and acute head trauma, Parkinson's disease, Alzheimer's disease, multiple sclerosis and spinal cord injury. The polynucleotides and polypeptides can also be used in diagnostic assays and in vaccines, and to identify agonists and antagonists useful for treating conditions associated with ANIC-BP-1B imbalance
Novel human acute neuronal induced calcium-binding protein like protein splice variant, useful for treating stroke, acute head trauma, Parkinson's disease, Alzheimer's disease multiple sclerosis, spinal cord
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel acute neuronal induced calcium binding protein type I ligand polypeptides, useful in the treatment of stroke, head trauma, multiple sclerosis, Parkinson's disease, Alzheimer's disease and spinal cord
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, acute neuronal induced calcium binding protein type 1 ligand; ANIC-BP-1; human disease; Etroke; head trauma; multiple sclerosis; Parkinson's disease; Alzheimar's disease; spinal cord injury; vaccine; gene therapy; fusion protein; Gal4 protein.

The invention relates to human acute neuronal induced calcium binding protein type 1 (ANIC-BP-1) ligand polypeptides and polynucleotides. Sequences of the invention are useful for treating human diseases including stroke, head trauma, multiple sclerosis, Parkinson's disease, Alzheimer's disease and spinal cord injury. They are also useful as vaccines. ANIC-BP-1 ligands are useful for identifying membrane bound soluble receptors. Polynucleotides of the invention are useful as diagnostic reagents, for chromosome localization studies, and as valuable tools for tissue expression studies. They are also useful in gene therapy. The present sequence is Ga14-human ANIC-BP-1 fusion protein comprising the Ga14 protein and a C-terminally linked human ANIC-BP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, acute neuronal induced calcium binding protein type 1 ligand, ANIC-BP-1; human diesase; stroke, head trauma; multiple sclerosis; Parkinson's disease; Alzheimer's disease; spinal cord injury; vaccine; gene therapy; fusion protein; LexA protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel acute neuronal induced calcium binding protein type I ligand polypeptides, useful in the treatment of stroke, head trauma, multiple sclerosis, Parkinson's disease, Alzheimer's disease and spinal cord
                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The
protein type 1 (ANIC-BP-1) ligand polypeptides and polynuclectides. Sequences of the invention are useful for treating human diseases including stroke, head trauma, multiple sclerosis. Parkinson's disease, Alzheimer's disease and spinal cord injury. They are also useful as vaccines. ANIC-BP-1 ligands are useful for identifying membrane bound soluble receptors. Polynucleotides of the invention are useful as diagnostic reagents, for chromosome localization studies, and as valuable tools for tissue expression studies. They are also useful in gene therapy. The present sequence is Lexa-human ANIC-BP-1 fusion protein comprising the LexA protein and a C-terminally linked human ANIC-BP-1
                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.

The present sequence is the Drosophila calcium binding protein DMO25. It was used in a sequence alignment to identify human calcium binding protein holds. The hOBP protein and the gene encoding it are useful for the diagnosis and treatment of the following types of disorder: cancers (such as adenocarcinomas), reproductive disorders (such as infertility, ovulatory defects, endometriosis, disruptions of the oestrus and menticular oycles, polycystic ovary syndrome and ovarian hyperstimulation), autoimmune disorders (such as benign prostatic hyperplasia and prostatitis), developmental disorders (such as Cushing's syndrome, muscular dystrophy and gonadal dysquensis), hereditary neuropathies, seizure disorders, immune disorders (such as AIDS, allergies, anaemia, asthma, atherosclerosis, choiceystitis, Crohn's disease, diabetes, Graves' disease, multiple sclerosis, psoriasis, colutis), and viral, bacterial, fungal, parasitic, protozoal and helminthic infections
                                                                                                                                                                                                                                                                             ô
polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fit.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human hCBP protein, and the nucleic acid encoding it, useful for e.g. diagnosis, prevention and treatment of cancers, immune, developmental or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL18176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present sequence is the C. elegans yeast-like CBP. It was used in a sequence alignment to identify human calcium binding protein hCBP. The hCBP protein and the gene encoding it are useful for the diagnosis and treatment of the following types of disorder: cancers (such as adenocarcinomas), reproductive disorders (such as infertility, ovulatory defeotes, endometriosis, disruptions of the osetrus and menstrual cycles, polycystic ovary syndrome and ovarian hyperstimulation), autoimmune disorders (such as benign prostatic hyperplasia and prostatitis), developmental disorders (such as Cushing's syndrome, muscular dystrophy and goorders (such as Allos, allergies, anaemia, asthma, and gonadal dysgenesis), hereditary neuropathies, seizure disorders, immune disorders (such as Allos, allergies), anaemia, asthma, atheresses, multiple sclerosis, psoriasis, rheumatoid arthritis, calsease, multiple sclerosis, psoriasis, rheumatoid arthritis, scleroderma, Sjogren's syndrome and ulcerative colitis), and viral, bacterial, fungal, parasitic, protozoal and helminthic infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human hCBP protein, and the nucleic acid encoding it, useful for e.g. diagnosis, prevention and treatment of cancers, immune, developmental or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGN primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food pupplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders in diagnostics, forensics, gene mapping, identification of mutations in diagnostics and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and and to acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this electronic format directly from MIPO at the printed specification, but was obtained in electronic format directly from MIPO at (II) and (II) accompany of the printed specification, but was obtained in electronic format directly from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, ollgomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed ectivity of is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biddiversing amino acid sequences. AEG00010-AEG30377 represent novel human diagnostic mino acid sequences. AEG00010-AEG30377 represent novel human diagnostic mino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from MUPO at the printed specification, but was obtained in electronic format directly from MUPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0;
